Breeding for insect resistance:

Genetic and metabolomic data fusion to unravel
whitefly resistance in tomato

Floor van den Elsen

WU Entomology; insect-plant interactions cluster

WU Plant Breeding-non host and insect resistance cluster

Whitefly biology

- *Bemisia tabaci*
 - Phloem/xylem feeder
 - Polyphagous (>500 species)
- Direct
 - Nutrient uptake adults/nymphs
 - Phytotoxicity
- Direct → Indirect
 - Honeydew source for fungi
 - Airborne spores stick to fruit and leaves
- Indirect
 - MAJOR CONCERN: Vector of plant viruses
 - 90% genus Begomovirus (TYLCV)

Heavy colonization

Uneven ripening

Sooty mold

ToCV; chlorosis/yellowing

TYLCV; dwarfing/curling

Whitefly control

■ Chemical control

- Many disadvantages

■ Durable control

- Parasitoids /predators
 - 1) Efficiency high greenhouse; low (semi)-field
 - 2) Viral transmission not optimally controlled
- Host Plant Resistance (HPR)
 - 1) Crop wild relative donor in HPR
 - 2) Screen wild species to define phenotype characteristics (xenosis/antibiosis)

Encarsia parasitizes a whitefly nymph

SCIENCEPHOTOLIBRARY

~omics data linkage in segregating populations to identify whitefly resistance traits

Schematic outline experimental work

Solanum wild relative x *Solanum lycopersicum*

Clip-on cage/no choice test

↓
140 F₂ genotypes

↓
Phenotyping: Whitefly resistance tests

Key parameters:

- I. Adult survival
- II. Fecundity

↓
BSA → Select extreme phenotype groups for metabolomics

↓
Chemoprofiling → GC- and LC-TOF-MS of groups → Multivariate data analyses

Set-up

Phenotyping F₂ population

- Experimental set-up
 - No choice screenings (toxicity)
 - Adult survival and fecundity

Key indicator traits for identification of *B. tabaci* fitness on host plant

Greenhouse set-up

No-choice set-up

F₂ Bionomics data/ Whitefly survival and fecundity- Bulked Segregant Analyses

Chemical platforms for analyzing F₂ phenotype groups

1. Metabolome profiling by GC-MS for detection of volatile and semi-volatile constituents
2. Metabolome profiling by LC-TOF-MS for detection of non-volatile constituents

Results

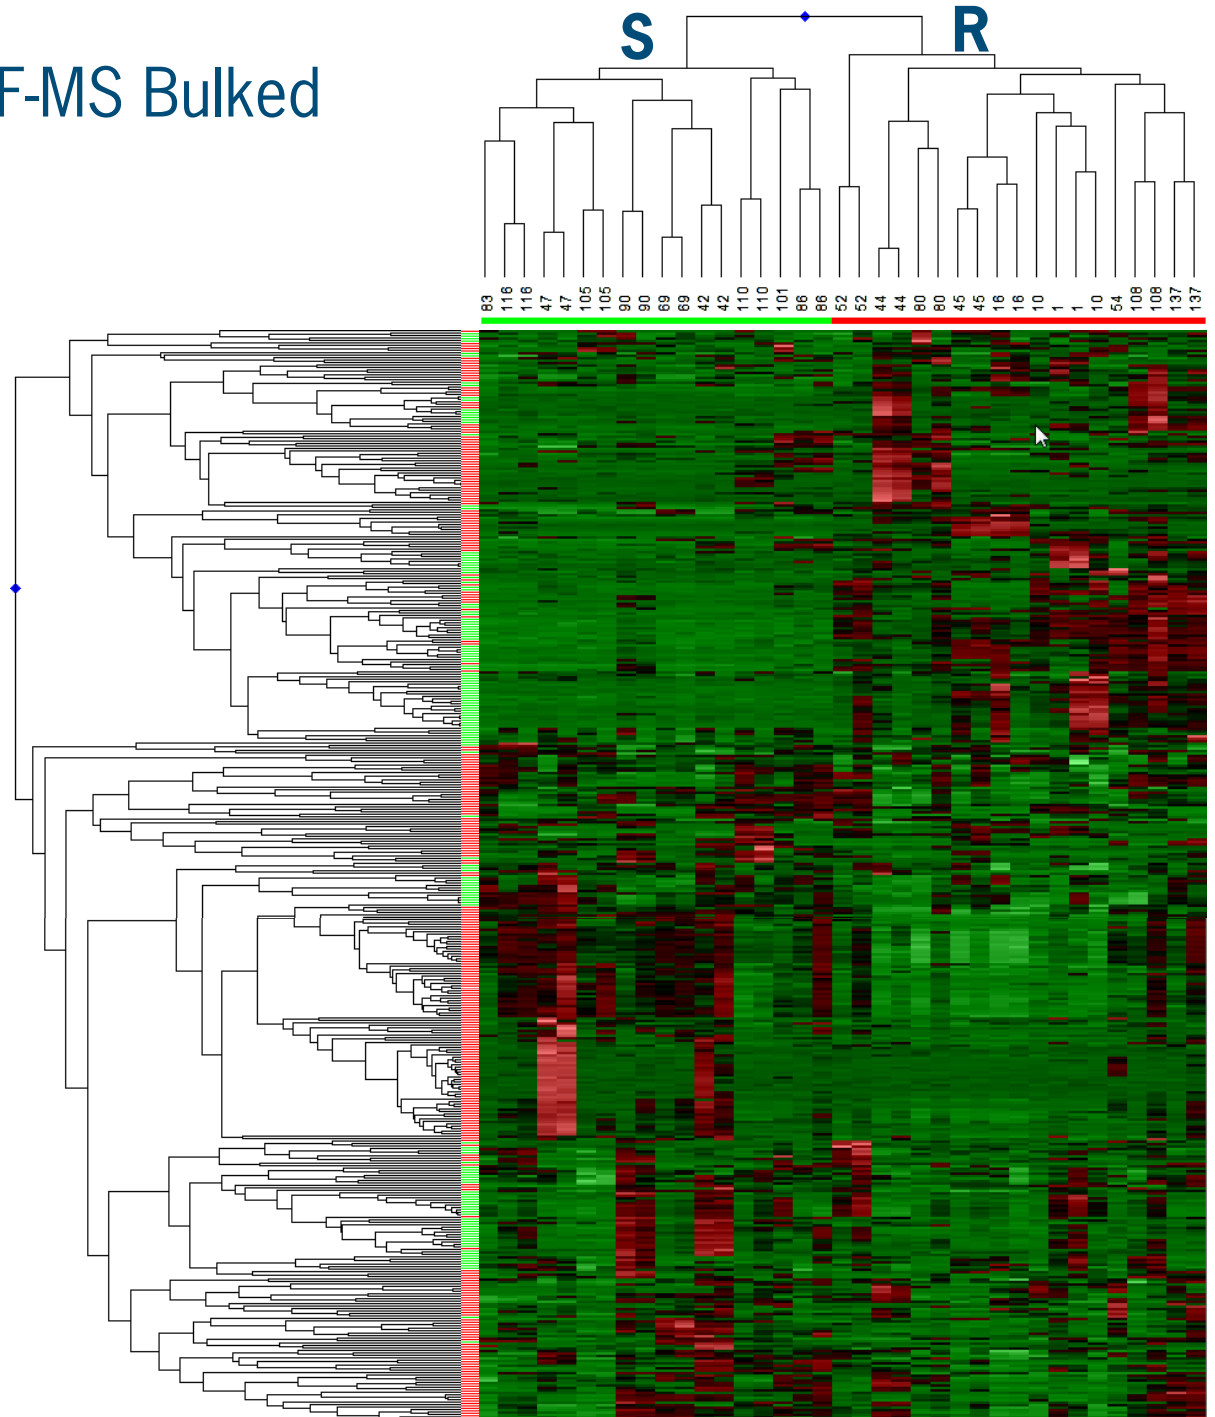

WAGENINGENUR

For quality of life

Merged GC- and LC-TOF-MS Bulk Segregant Analyses

1. 10 *BTres*:10 *BTsus*
2. Hierarchical cluster analyses
3. Inter- intragroup differentiation

GC-MS Discriminant Analyses

- Multivariate and univariate statistics on complete metabolite profiles (OPLS-DA and q-values from FDR)
- **GC-MS** 74 out of the 146 compounds correlated with resistance (n=62) or susceptibility (n=12)
- **LC-TOF-MS** 123 out of the 297 compounds correlated with resistance (n=39) or susceptibility (n=84)

Results

Schematic outline experimental work

Chemoprofiling: GC-MS analyses of 140 F₂ plants

Genotyping: Genetic map constructed with AFLP and SNP markers

Detection phQTLs

Detection mQTLs

Results

WAGENINGEN UR

For quality of life

Confirmation QTLs in next generation

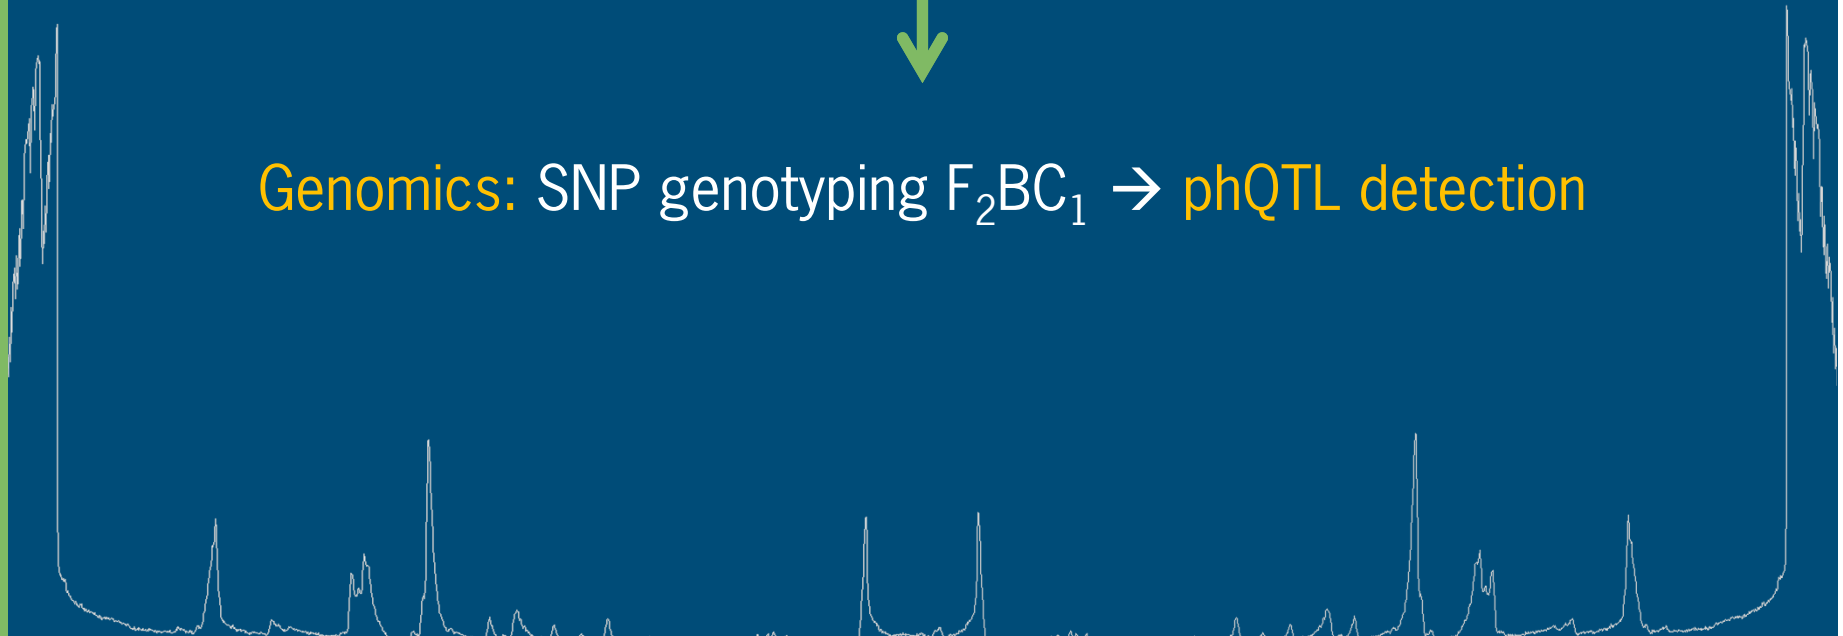

Phenomics: No choice screening F_2BC_1 (R $F_2 \times EC$)

- I. Adult survival
- II. Fecundity

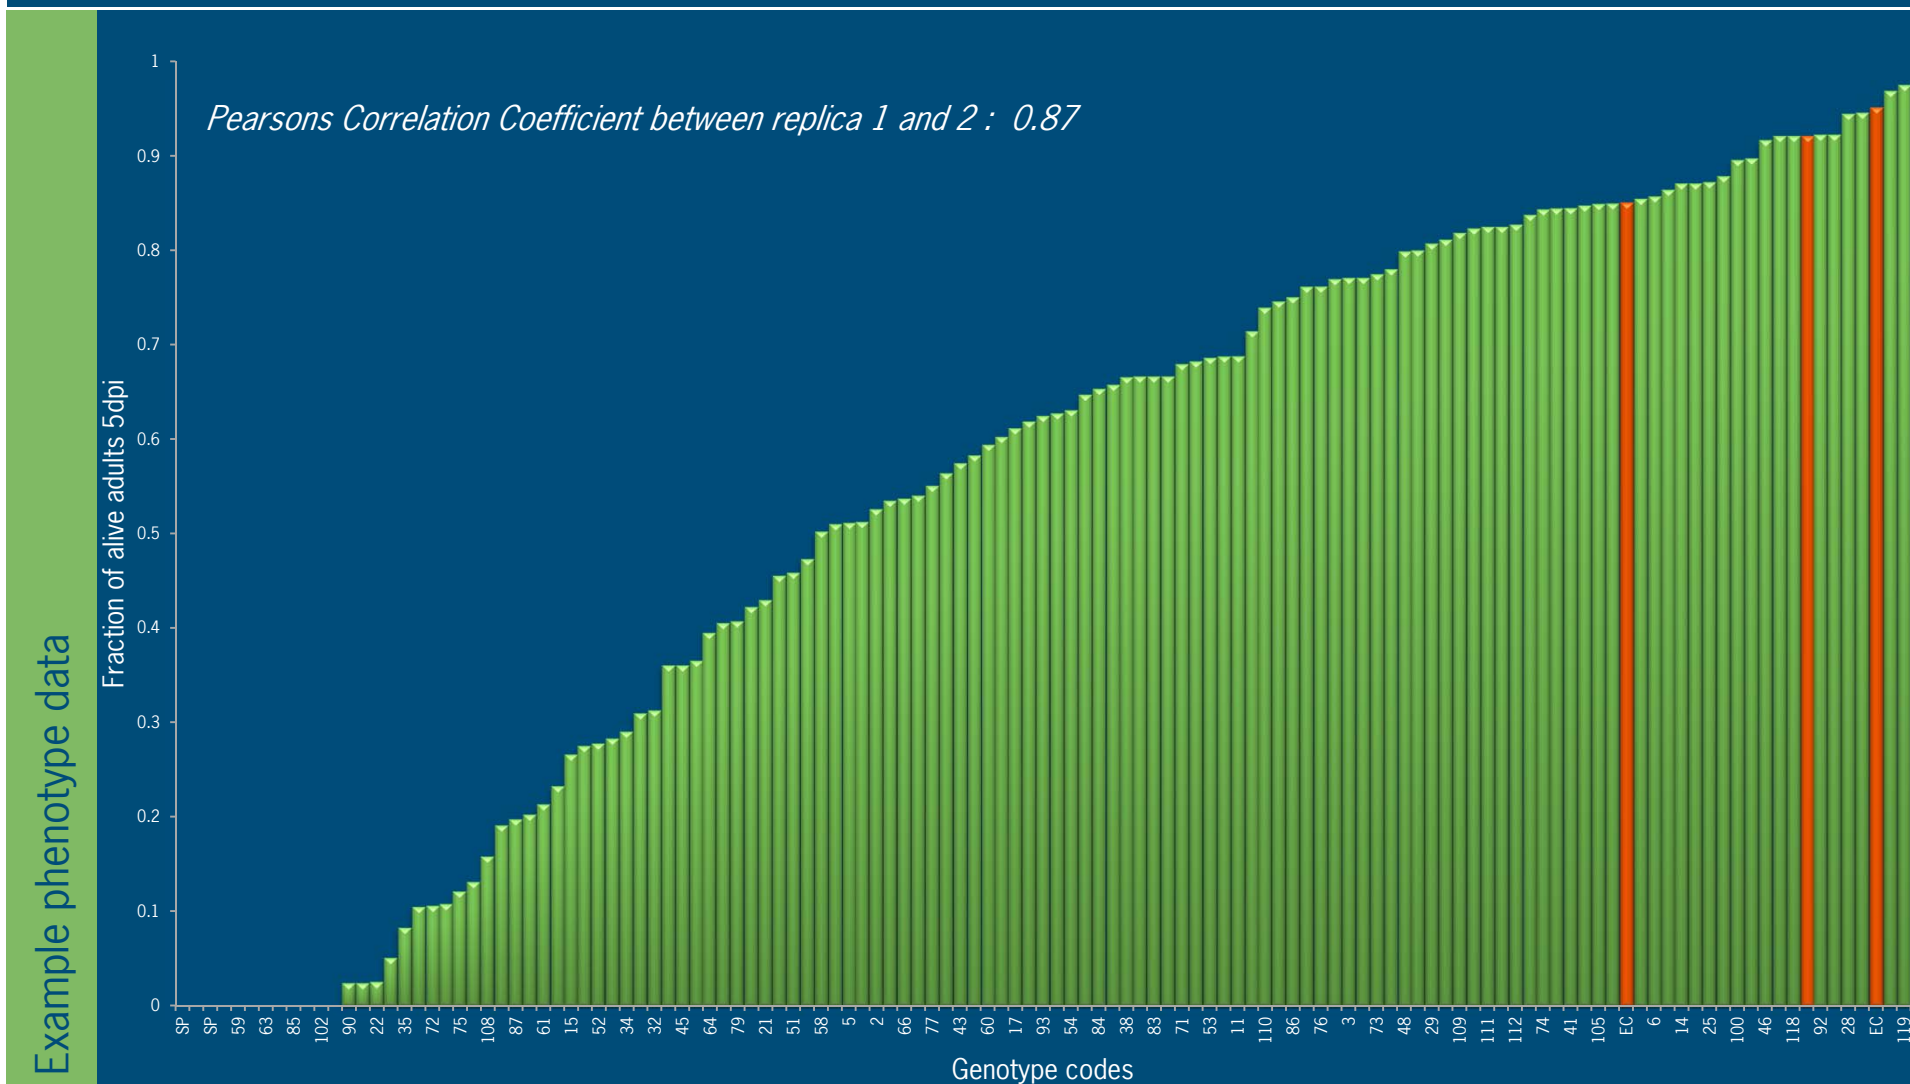

Genomics: SNP genotyping F_2BC_1 → phQTL detection

Results

Bionomics data/survival F₂BC₁

phQTL and mQTL mapping

- All data for phQTL and mQTL analyses collected:
 - phQTLs mapped for F_2 and F_2 BC₁-44
 - mQTLs from GC-MS mapped for F_2

Phenotypic and metabolomic QTLs for whitefly resistance

- phQTLs F2BC1-44
- phQTLs F2
- mQTL resistant bulk
- mQTL susceptible bulk

QTL mapping

■ QTLs

- Co-localization of phQTLs with mQTLs
- Co-localization of mQTLs
- Minor phQTLs in F_2 – Major phQTLs in F_2BC_1

Schematic outline experimental work

Chemotyping: LC-TOF-MS of 119 F₂BC₁ plants

Genotyping: SNP genotyping of F₂BC₁ for mQTL detection

Results

WAGENINGEN UR

For quality of life

LC-TOF-MS fingerprinting in F₂BC₁-44

- LC-TOF-MS shows variation in chemoprofiles between F₂BC₁ genotypes
 - Trait complexity is reduced. Only a small number of metabolites contribute to whitefly resistance trait
- Targeted → identify and QTL mapping of acyl sugars

Results

LC-TOF-MS fingerprinting in F₂BC₁-44 (whole spectrum)

Results

Wild donor

F₂-44

F₂BC₁-44

QTLs for a whitefly resistance-related Acyl sugars

- Co-localizes with phQTLs F₂BC₁-44

- Co-localizes with mQTLs and phQTLs F₂

- Major metabolite QTLs identified (Explain up to 49.1% of trait)

In conclusion

- Data fusion from different platforms successful approach for breeding for insect resistance
 - ✓ Promotes accurate selection for HPR breeding → reduced trait complexity
 - ✓ Detection of hotspot QTLs
 - ✓ Validates relations between resistance traits and correlating (e.g. biochemical/morphological) traits
